The cooling system

DD1-21-A Circuit Diagram Proline Model UFZ155P-U

Title: Product Manager

Issue Date: 2009-12-18

Trouble shooting guide

The freezer does not get cold at all. Not plugged in. Is the circuit breaker tripped or blown fuse? Plug in. Plug in. Put on the home circuit breaker or change the step of the colder temperature. Is the freezer control dialed set to correct location? Set it to a colder temperature. Set it to a colder temperature. Is the freezer placed in direct sunlight or closely a heat source? Move the freezer to proper location. Close the door completely. Is the door opened too frequently or too long? Does the door gasket seal property? Is the freezer overloaded? The front frame and two sides of the cabinet are hot condensation occurs. The front frame and two sides of the cabinet are hot condensation occurs. Condensation concurs. Condensation concurs when you leave the door open for a long time. The freezer is noisy. Water bubbling comes from the refrigerant circulating of the freezer. Normal state. Contraction and expansion of the insulation inside the walls may cause popping and cracking. Normal state.	
ls the circuit breaker tripped or blown fuse? Put on the home circuit breaker or change the label.	
The freezer does not get cold enough. Is the door closed completely? Is the door closed completely? Is the door opened too frequently or too long? Does the door gasket seal properly? Is the freezer overloaded? The front frame and two sides of the cabinet are condensation occurs. The front frame and two sides of the cabinet are condensation occurs. The freezer is not level and firm. Water bubbling comes from the refrigerant circulating of the freezer. Normal state. Normal state. Contraction and expansion of the insulation inside the walls may cause popping and cracking. Normal state.	new fuse.
The freezer does not get cold enough. Is the door closed completely? Is the door opened too frequently or too long? Open the door less often, Does the door gasket seal properly? Is the freezer overloaded? The front frame and two sides of the cabinet are hot condensation occurs. The front frame and two sides of the cabinet are hot condensation occurs. The freezer is not level and firm. Place the freezer in a level location. Water bubbling comes from the refrigerant circulating of the freezer. Normal state. Contraction and expansion of the insulation inside the walls may cause popping and cracking. Normal state.	
Is the door opened too frequently or too long? Open the door less often,	
Is the door opened too frequently or too long? Open the door less often, Does the door gasket seal properly? Is the freezer overloaded? The front frame and two sides of the cabinet are condensation occurs. The front frame and two sides of the cabinet are condensation occurs. The front frame and two sides of the cabinet are condensation occurs. The front frame and two sides of freezer. That makes freezer's temperture lowquckly and save the power consumption Condensation occurs. The freezer is not level and firm. Water bubbling comes from the refrigerant circulating of the freezer. Normal state. Contraction and expansion of the insulation inside the walls may cause popping and cracking. Normal state.	
Is the freezer overloaded? The front frame and two sides of the cabinet are condensation occurs. The front frame and two sides of the cabinet are condensation occurs. The front frame and two sides of freezer. That makes freezer's temperture lowquckly and save the power consumption Condensation occurs. The freezer is not level and firm. Water bubbling comes from the refrigerant circulating of the freezer. Normal state. Contraction and expansion of the insulation inside the walls may cause popping and cracking. Normal state.	
The front frame and two sides of the cabinet are condensation occurs. Hot-pipe is installed in the front frame and two sides of freezer. That makes freezer's temperture lowquckly and save the power consumption Condensation occurs. Condensation occur when you leave the door open for a long time. Normal state. Vibrations The freezer is not level and firm. Place the freezer in a level location. Water bubbling comes from the refrigerant circulating of the freezer. Normal state. Contraction and expansion of the insulation inside the walls may cause popping and cracking. Normal state.	
The front traine and two sides of the cabinet are condensation occurs. In the front traine and two sides of the cabinet are condensation occurs. In the front traine and two sides of the cabinet are condensation occurs. In the front traine and two sides of the cabinet are condensation occurs. In the front traine and two sides of the cabinet are condensation occurs. In the front traine and two sides of the cabinet are condensation occurs. In the front traine and two sides of the front trained two sides of the front trained occurs. In the front traine and two sides of the front trained occurs. In the front traine and two sides of the front trained occurs. In the front traine and two sides of the front trained occurs. In the front traine and two sides of the front trained occurs. In the front trained and two sides of the front trained occurs. In the front traine and two sides of the front trained occurs. In the front traine and two sides of the front trained occurs. In the front traine and two sides of the front trained occurs. In the front traine and two sides of the front trained occurs. In the front trained occurs occurs. In the front trained occurs occurs. In the front trained occurs occurs. In the front trained occurs. In the front traine and two sides occurs occurs. In the front trained occurs occurs. In the front trained occurs oc	
Condensation can occur when you leave the door open for a long time. Normal state. Vibrations The freezer is not level and firm. Place the freezer in a level location. Water bubbling comes from the refrigerant circulating of the freezer. Normal state. Contraction and expansion of the insulation inside the walls may cause popping and cracking. Normal state.	
Water bubbling comes from the refrigerant circulating of the freezer. Normal state. Contraction and expansion of the insulation inside the walls may cause popping and cracking. Normal state.	
Contraction and expansion of the insulation inside the walls may cause popping and cracking. Normal state.	
5 The freezer is noisy.	
Is the freezer unstable or touching the wall? Keep the freezer leaving the wall.	
Is the freezer not level? Adjust the freezer leveling.	
The door can not close Were the doors not properly installed? Assure the doors installed propertly.	
properly. Is the door gasket dirty and distortion? Cleaning and flatting the door gasket.	
Is the ambient temperature too high?	
Is the temperature controller is set at "strong" position Sets it at a right position.	
7 Operating for all long time. Too much food is loaded into the freezer and insufficient spaces for airflow. Load less food into the freezer.	
The door were not closed completely or the gasket not sealing enough. Close the doors completely or make the gasenough.	sket sealing
Open the door too frequently. Decrease the open-door times.
